

IN THE SPECIFICATION:

The last paragraph bridging pages 5 and 6 has been amended as follows:

A loop library 36a in which various types of existing data concerning loops and past setting data are stored in association with each other is accommodated in the data memory 36. The existing data contained in the loop library 36a includes: line drawing data depicting a plurality of different types of wire loop models that correspond to various modes (see Figure 4) of individual types in which the loop shape is classified according to inclination; data concerning default values for various types of operating parameters in the respective modes, the number of editing handles 45 in the respective modes (see Figure 5); and operating ranges of the respective editing handles 45, etc. These existing data construct respective sets of data files in which the line drawing data, data concerning the default values of the various types of operating parameters, and data concerning the number of the editing handles and the operating ranges of the editing handles 45, etc. are accommodated in association with each other for each single loop consisting of a single wire connecting a certain two bonding points. The number of editing handles 45 is one or more for each single loop.
